DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

2. Claims 1-4, 5-8 are rejected under 35 U.S.C. 102(b)/(e) as being anticipated by Kato et al. (EP 851 516 A2)/(6,083,642).

Kato et al. ('642) teaches a non-sintered positive electrode material for alkaline storage batteries comprising nickel hydroxide particles and a cobalt oxide as a conductive agent. The cobalt oxide has an average valence of cobalt higher than 3.0. Kato et al. teaches in column 11, lines 50-65, that nickel hydroxide particles contain Co and Zn. Kato et al. teaches in column 11, line 66 to column 12, line 5, that the positive

electrode comprises 100 parts by weight of the solid solution nickel hydroxide particles and 7.0 parts by weight of the cobalt oxide was added together $[7/107=6.54 \text{ wt\%}]$. Kato et al. teaches in column 17, lines 46-60, that the counter electrode was a hydrogen storage alloy negative electrode. Kato et al. teaches in column 6, line 66 to column 7, line 2, that the weight ratio of the higher cobalt oxide comprising gamma-cobalt oxyhydroxide to the nickel hydroxide particles is preferably with a range from 0.02-0.10. Kato et al. teaches in columns 21-22, Example 2, that the positive electrode material comprising the nickel hydroxide particles with cobalt and zinc was charged in an aqueous cobalt sulfate solution and an aqueous sodium hydroxide solution thereby obtaining Co(OH)_2 -coated nickel hydroxide particles.
